The following report(s) provides findings from an FDA-initiated query using Sentinel. While Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Sentinel, and seeking to better understand Sentinel capabilities.

Data obtained through Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from Sentinel in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Sentinel queries will continue to be communicated through existing channels.

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care practitioners.

The following report contains a description of the request, request specifications, and results from the modular program run(s).

Overview for Request: cder_sir_wp005

Request ID: cder_sir_wp005_nsdv_v01

Request Description: In this report, we performed signal identification by monitoring non-pregnancy and non-cancer outcomes among new users of filgrastim-sndz (Zarxio) and new users of filgrastim (Neupogen).

Sentinel Routine Querying Module: Cohort Identification and Descriptive Analysis (CIDA) module, version 11.3.0, with Propensity Score Analysis and Signal Identification modules.

Data Source: We distributed this query to five Sentinel Data Partners on December 9, 2022. The study period included data from November 5, 2016 through distribution date. See Appendix A for a list of dates of available data for each Data Partner.

Study Design: We identified adults with incident use of filgrastim-sndz or filgrastim among a cohort with no use of non-index biosimilars of filgrastim on index date or in the 365 days prior. We calculated propensity scores (PS) for the two cohorts and matched the users using 1:1 fixed ratio matching. Two sets of PS models were created: one including calendar year and one without. We monitored matched pairs for non-pregnancy and non-cancer outcomes. This is a Type 2 analysis using the Propensity Score Analysis and Signal Identification modules in the Query Request Package (QRP) documentation.

Exposures of Interest: Only the first qualifying treatment dispensing or administration of filgrastim-sndz and filgrastim was evaluated. We defined exposures using National Drug Codes (NDCs) and Healthcare Common Procedure Coding System (HCPCS), Level II codes. NDCs were queried in the dispensing and procedure tables in the Sentinel Common Data Model (SCDM) format. See Appendix B for generic and brand names of medical products and Appendix C for HCPCS used to define exposures of interest.

Cohort Eligibility Criteria: We required eligible members to be aged 18 years or older and to be continuously enrolled in health plans with medical and drug coverage for at least 400 days prior to the index date, during which gaps in coverage of up to 45 days were allowed. We defined new use as no evidence of the index-defining exposure in the 365 days prior to index date. We also excluded patients with use of the comparator exposure or to other filgrastim biosimilars and related biological product (Nivestym, Releuko or Granix) on index date or in the 365 days prior to the index date. Exclusion criteria were defined using National Drug Codes (NDCs) and Healthcare Common Procedure Coding System (HCPCS), Level II codes. NDCs were queried in the dispensing and procedure tables in the SCDM format. See Appendix D for generic and brand names of medical products and Appendix E for HCPCS used to define non-exposure exclusion criteria.

Follow-up Time: Follow-up began on the day after index dispensing and continued for 183 days or until the first occurrence of any of the following: 1) death, 2) disenrollment, 3) end of the query period, 4) end of Data Partner data, 5) dispensing or administration of opposite study drug, or 6) dispensing or administration of non-study drug filgrastim biosimilars.

Baseline Characteristics: PS covariates in a typical signal identification analysis were selected to be general health indicators and thus include concepts in the Centers for Medicare and Medicaid Services (CMS) Chronic Conditions Warehouse (CCW), screenings or other indications of health care seeking behavior, and frailty measures among other characteristics. We assessed the following characteristics on index date and included them in the PS model: continuous age, sex, calendar year, race, ethnicity. As a sensitivity, we ran a secondary PS model without calendar year included but with all other characteristics of the primary PS model remaining the same.

We assessed the following characteristics in the 400 days prior to index date and included them in the PS model: medical and healthcare service utilization; Charlson/Elixhauser combined comorbidity score¹; acute myocardial infarction (AMI); attention-deficit/hyperactivity disorder (ADHD), conduct disorder, hyperkinetic syndrome; alcohol use disorders; Alzheimer's disease; anemia; anxiety disorders; arrhythmia; asthma; atrial fibrillation and flutter; autoimmune disease; bacterial infection; benign prostatic hyperplasia; breast cancer; colorectal cancer; endometrial cancer; lung cancer; prostate cancer; urologic cancer; cataracts; chemotherapy; chronic kidney disease (CKD); end-stage renal disease (ESRD) or dialysis; coagulopathy; colonoscopy; chronic obstructive pulmonary disease (COPD); cystic fibrosis and other metabolic developmental disorders; degenerative diseases of central nervous system (CNS); depression, bipolar or other depressive mood disorders; diabetes; insulin; anti-diabetics; drug use disorders; durable medical equipment; epilepsy; fecal occult blood test; fibromyalgia, chronic pain, and fatigue; fluid and electrolyte disorder; gallstones; glaucoma;

We assessed the following characteristics on the 30 days prior to index date and included them in the PS model: chemotherapy; bone marrow harvest; bone marrow transplant.

Additionally, the following characteristics were also captured but not included in the PS model. In the 400 days prior to the index date, we collected: autism spectrum disorders; bipolar disorder; cancer (any of breast, colorectal, endometrial, lung, prostate, urologic cancers); any cancer; cerebral palsy; cancer or chemotherapy; CKD or ESRD or dialysis; depressive disorders; diabetes or insulin; diabetes or insulin or anti-diabetics; human papillomavirus (HPV) DNA test; intellectual disabilities and related conditions; Kawasaki disease; learning disabilities; other developmental delays; Reyes syndrome; schizophrenia; sensory impairment (blindness and visual impairment); sickle cell disease; spina bifida and other congenital anomalies of the nervous system; traumatic brain injury and non-psychotic mental disorders due to brain damage. In all patient history prior to index date, we collected exposure to: filgrastim; filgrastim-sndz; pegfilgrastim and its biosimilars.

All of these characteristics were defined using NDCs; International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) diagnosis codes; ICD-10, Procedure Coding System (ICD-10-PCS) procedure codes; Healthcare Common Procedure Coding System (HCPCS), Level II codes; Current Procedural Terminology, Fourth Edition (CPT-4), Category I; CPT-4, Category II; and CPT-4, Category III codes. See Appendix F for generic and brand names of medical products and Appendix G for diagnosis or procedure codes used to define baseline characteristics.

Propensity Score Adjustment: PS was calculated using the baseline characteristics noted above. Matching was performed using 1:1 nearest neighbor matching without replacement on the probability scale using a caliper of 0.025. Two sets of models were created: one adjusting for calendar year and one without.

Outcome Assessment via Signal Identification: Among the 1:1 matched filgrastim and filgrastim-sndz pairs, we evaluated new health outcomes of interest (HOI). We used a hierarchical tree of ICD-10-CM diagnostic codes excluding C00-D49 (Neoplasms), O00-O9A (Pregnancy, childbirth and the puerperium), P00-P96 (Certain conditions originating in the perinatal period), Q00-Q99 (Congenital malformations, deformations, and chromosomal abnormalities), V00-Y99 (External causes of morbidity), and Z00-Z99 (Factors influencing health status and contact with health services).

Overview for Request: cder_sir_wp005

In our primary analysis, we identified incident HOIs as the first inpatient or emergency department diagnosis to occur in 400 days relative to the date of HOI diagnosis. For an outcome to be considered incident, there were required to be no outcomes with the same first three digits of the ICD-10-CM code in the prior 400 days in any setting. We evaluated incident HOIs beginning one day after exposure initiation until the end of the exposure episode provided that both members of the matched pair were still able to contribute at-risk time for the outcomes of interest. In a sensitivity analysis, we identified the HOIs in any setting (inpatient, emergency department, or ambulatory). All other identification rules remained unchanged. This was done for both of the PS models, resulting in four sets of signal identification results.

Tree-Based Scan Statistic: These data were evaluated via the TreeScan™ software (v.2.0) to determine whether there were imbalances in outcome occurrence between the two groups that rose to the level of statistical significance. TreeScan™ is a data-mining software that implements tree-based scan statistics. Under the null hypothesis, there is no position on the tree where outcomes are expected to occur in a ratio other than the fixed match ratio (1:1) of the cohort. We used unconditional Bernoulli tree-based scan statistic to calculate the log likelihood ratio for every 3rd-6th level node of the outcome tree. See Appendix H for calculation of test statistic.

Please see Appendices I-K for the specifications of parameters used in this request and a design diagram.

Limitations: Algorithms to define exposures, outcomes, inclusion and exclusion criteria, and covariates are imperfect and may be misclassified. Therefore, data should be interpreted with this limitation in mind.

Monitoring Period - used to define time periods of interest for both sequential analysis and simple cohort characterization requests.

Principal Diagnosis (PDX) - diagnosis or condition established to be chiefly responsible for admission of the patient to the hospital. 'P' = principal diagnosis, 'S' = secondary diagnosis, 'X' = unspecified diagnosis, '.' = blank. Along with the Care Setting values, forms the Caresetting/PDX parameter.

Valid options are the product approval date, product marketing date, other requester defined date, or computed start marketing date.

Switch Pattern Cohort Inclusion Strategy - indicates how the switch pattern cohort inclusion date will be used: 01: used only as a switch cohort entry date. First treatment episode dispensing date is used as index for computing time to first switch; 02: used as switch cohort entry date and as initial switch step index date for computing time to first switch.

In this approach, the PSM tool will produce de-identified, risk-set level datasets instead of or in addition to individual-level output. Whereas each observation in the patient-level datasets represents one patient in the cohort, each observation in the risk set dataset represents one event. Risk sets are created at the Data Partner site, returned to the SOC, aggregated, and used to calculate effect estimates via case-centered logistic regression.

Subgroup Analysis - may be conducted using any requester-defined covariates. Subgroup analyses may be performed in the

Zero Cell Correction - indicator for whether to screen variables with a zero correction added to each cell in the confounder/outcome 2x2 table. Recommended when the number of exposed outcomes is fewer than 150.

⁵The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

Appendix H. Calculation of the Test Statistic for Unconditional Bernoulli Probability

The log likelihood ratio (LLR) based test statistic T can be calculated as:

Where: T = unconditional Bernoulli tree-based scan statistic
 c_G = cases in the treatment group for a given node G
 n_G = cases in the reference group for a given node G
 p = probability of being in the treatment group
(for 1:1 matched pairs, this is 0.5)
 G = node of interest

$$LLR(G) = \ln \left(\frac{\left(\frac{c_G}{c_G + n_G} \right)^{c_G} \left(\frac{n_G}{c_G + n_G} \right)^{n_G}}{(p)^{c_G} (1 - p)^{n_G}} \right) I \left(\frac{c_G}{c_G + n_G} > p \right)$$

$$T = \max_G LLR(G)$$

¹Expression in blue: This is the maximum likelihood estimation. It takes the form of a Bernoulli probability model. The numerator of the equation is based on the observed data. The denominator of the equation is based on the expectation under the null hypothesis. If the observed data “fit” the pattern of the null hypothesis, then this expression would be 1. The “log” of the function is for mathematical convenience. The $\ln(1) = 0$.

²Expression in green: This is an indication function. It means that a log-likelihood ratio (LLR) is ONLY recorded if there are more cases in the treatment group (ACEI) than expected. So, a LLR is only calculated among nodes on the tree when the LLR would normally exceed 0 (or the likelihood ratio would exceed 1).

³Expression in red: The Log Likelihood Ratio is calculated for every position (node) on the tree including each individual diagnosis code and groupings of codes. For any dataset (i.e., across all nodes of the tree), the test statistic for that dataset is the maximum across all the nodes.

¹Index start date identifies the date on which patients may begin contribute eligible index exposures/events. Data prior to the index start date may be used to determine enrollment, washout, and other cohort inclusion criteria.

²The query will establish a fixed risk window analysis.

³TreeScan software will be used to evaluate signal identification.

ICD-10-CM, HCPCS, and CPT codes are provided by Optum360. ICD-10-CM codes were mapped from ICD-9-CM codes using the Centers for Medicare and Medicaid Services General Equivalence Mappings. NDC codes are checked against First Data Bank's "National Drug Data File (NDDF®) Plus."
